MONTHLY

smile

A very dirty little fellow came in from playing outside and asked his mother, "Who am I?" Ready to play the game, his mother replied, "I don't know. Who are you?"

"WOW" cried the child. "Mrs. Johnson was right! She said I was so dirty, my own mother wouldn't recognize me!"

FREE SPOT KIT - VALUE \$19.95

CLEANING

zone

There are good reasons to vacuum your carpets at least weekly. Vacuuming is essential for keeping dirt and dust from embedding itself in your carpets.

Each fiber of yarn is designed to reflect light which helps your carpet remain bright and the colours vibrant. If dirt and dust are not removed or kept away, serious scratching and wear can result. These scratches can restrict the natural reflection thus causing your carpets to look dingy and dirty, even after a professional cleaning. Besides this, it can significantly reduce the overall life of the carpet. Keep in mind that carpet manufacturers recommend professional cleaning at least every 12 - 18 months.

water DAMAGE ZONE

tip

WINTER IS UPON US
ARE YOU READY?

At this time of year people need to think of what it will take to keep snow and rain out of their house, and how to protect pipes from freezing.

Here Are Some Tips:

- Shut off all outside taps from the inside and then go outside and drain the faucet.
- Do not leave hoses connected to the faucet because they could still hold water and freeze.
- If it snows, clean your outside drains immediately so that water does not pool and go over doorsills.
- Early in the fall clear the leaves and debris from perimeter drains and eaves. Keep excess moisture away from the foundation.

MOULD

zone

tip

Many people wonder if they live in a mouldy environment. Mould is not usually hard to spot. If you have experienced a water leak of some kind and it wasn't remediated properly you may see things growing on the walls or carpet. Upon recognition have it dealt with immediately. A musty odor may also be evidence of a mouldy environment. These odors call for more extensive methods of detection. When you smell mould usually it is because it is still growing and thus giving off mould volatile organic compounds as it digests its food. It could be growing in the walls or in an area not easily seen. Testing the environment for the presence of spores and mould fragments may be required in order to detect the source. We can't over-emphasize the need for proper and efficient water damage restoration in order to prevent mouldy environments from ever developing.
